

# INVARIANTS OF JETS AND THE CENTER FOR $\hat{\mathfrak{sl}}_2$

IVAN KARPOV, IVAN LOSEV

**ABSTRACT.** This is an expository talk for the student learning seminar on the representation theory of affine Kac-Moody algebras at the critical level. We develop the formalism of jet schemes and use it to compute the algebra of invariants for the action of the group  $G[[t]]$  on its adjoint representation  $\mathfrak{g}[[t]]$ . In turn, we use this computation to show that the center of  $V_{\kappa_c}(\hat{\mathfrak{sl}}_2)$  is the polynomial algebra freely generated by the Sugawara modes. We then identify the center of  $V_{\kappa_c}(\hat{\mathfrak{sl}}_2)$  with the algebra of polynomial functions on the space of projective connections on the disc  $D = \text{Spec}(\mathbb{C}[[t]])$  thus getting a coordinate free description of the center. We mostly follow [2].

## 1. INVARIANTS AND THE CENTER

**1.1. Introduction.** Throughout the talk, the base field is  $\mathbb{C}$ .

Let  $\mathfrak{g}$  be a finite-dimensional simple Lie algebra. The corresponding connected algebraic group  $G$  acts on  $\mathfrak{g}$  (via the adjoint representation), yielding  $G$ -actions by graded algebra automorphisms on  $\mathbb{C}[\mathfrak{g}] (\cong S(\mathfrak{g}))$  and by filtered algebra automorphisms on the universal enveloping algebra  $\mathcal{U}(\mathfrak{g})$ .

Let  $\mathfrak{h} \subseteq \mathfrak{g}$  denote a Cartan subalgebra, and  $W$  be the corresponding Weyl group. The following is due to Chevalley:

**Proposition 1.1.1.** (A) *We have a graded algebra isomorphism  $\mathbb{C}[\mathfrak{g}]^G \simeq \mathbb{C}[\mathfrak{h}]^W$ .*  
 (B) *The algebras in (A) are isomorphic to the polynomial algebra in  $r := \text{rk } \mathfrak{g}$  homogeneous generators, to be denoted by  $P_1, \dots, P_r$ .*

It is also well-known due to Harish-Chandra (see, e.g., [3, Ch. 23]) that the center  $\mathcal{Z}(U(\mathfrak{g}))$  of  $U(\mathfrak{g})$  is isomorphic to  $\mathbb{C}[\mathfrak{h}]^W$  as a filtered algebra. The Harish-Chandra theorem can be viewed as a finite dimensional counterpart of the main result for the seminar: a description of the center of the completed universal enveloping algebra of  $\hat{\mathfrak{g}}$  at the critical level.

We write  $\mathcal{O}$  for  $\mathbb{C}[[t]]$ ,  $G_{\mathcal{O}}$  for the group of  $\mathcal{O}$ -points of  $G$  and  $\mathfrak{g}_{\mathcal{O}}$  for its Lie algebra,  $\mathfrak{g} \otimes \mathcal{O}$ , compare to [5, Section 3]. The main goal of the first part of the talk is to get an analog of Proposition 1.1.1 for the action of the group  $G_{\mathcal{O}}$  on  $\mathfrak{g}_{\mathcal{O}}$ : we will see that the elements  $P_{i,n}$  with  $i = 1, \dots, r$  and  $n < 0$  introduced in [5, Section 3.4] are free generators of  $\mathbb{C}[\mathfrak{g}_{\mathcal{O}}]^{G_{\mathcal{O}}}$ . We will use this to show that the Sugawara modes  $S_n|0\rangle \in V_{\kappa_c}(\hat{\mathfrak{sl}}_2)$  (with  $n \leq -2$ ) generate the center of  $V_{\kappa_c}(\hat{\mathfrak{sl}}_2)$ .

**1.2. Jet schemes.** In order to compute the algebra  $\mathbb{C}[\mathfrak{g}_{\mathcal{O}}]^{G_{\mathcal{O}}}$  we will need the formalism of jet schemes (a.k.a. arc spaces).

**1.2.1. Definition via functor of points.** Let  $\text{CommAlg}$  denote category of commutative associative unital  $\mathbb{C}$ -algebras, its opposite category is identified with the category of affine schemes over  $\text{Spec}(\mathbb{C})$ . In particular, an arbitrary scheme  $X$  over  $\text{Spec}(\mathbb{C})$  gives rise to its *functor of points*

$$\text{Mor}(\text{Spec}(\cdot), X) : \text{CommAlg} \rightarrow \text{Sets}$$

sending an algebra  $R$  to the *set of  $R$ -points of  $X$* . One recovers  $X$  uniquely from its functor of points, however, not every functor  $\text{CommAlg} \rightarrow \text{Sets}$  is representable (i.e., is a functor of points for a scheme).

**Definition 1.2.1.** *Let  $X$  be a finite type scheme over  $\text{Spec}(\mathbb{C})$ . We define the jet functor of  $X$*

$$J_X : \text{CommAlg} \rightarrow \text{Sets}$$

*by sending  $R$  to the set of all morphisms  $\text{Spec}(R[[t]]) \rightarrow X$  (of schemes over  $\text{Spec}(\mathbb{C})$ ).*

**Proposition 1.2.2.** *The functor  $J_X$  is represented by a scheme to be denoted by  $JX$  and called the jet scheme (a.k.a. arc space) of  $X$ .*

We will sketch a proof (and a construction of  $JX$ ) below in this section.

We also note that for general Yoneda reasons,  $J$  is a functor (from the category of finite type schemes to the category of schemes). For a morphism  $\varphi : X \rightarrow Y$  we write  $J\varphi$  for the induced morphism  $JX \rightarrow JY$ .

1.2.2. *Affine case.* We first give a constructive proof of Proposition 1.2.2 in the case when  $X$  is affine.

**Example 1.2.3.** *First, set  $X = \mathbb{A}^m = \text{Spec}(\mathbb{C}[x_1, \dots, x_m])$ . For an arbitrary commutative  $\mathbb{C}$ -algebra  $R$ , the set of  $R[[t]]$ -points of  $X$  is*

$$\text{Hom}_{\text{Alg}}(\mathbb{C}[x_1, \dots, x_m], R[[t]]).$$

*Of course, any algebra homomorphism  $\phi : \mathbb{C}[x_1, \dots, x_m] \rightarrow R[[t]]$  is uniquely determined from the images  $\phi(x_i)$  that are formal power series*

$$\phi(x_i) = \sum_{n < 0} a_{i,n} t^{-n-1}, a_{i,n} \in R.$$

*Thus, the set of  $R$ -point of  $JX$  is the set  $\{a_{i,n} \in R \mid i = 1, \dots, m, n < 0\}$  and hence*

$$JX = \text{Spec } \mathbb{C}[x_{i,n} \mid i = 1, \dots, m, n < 0].$$

**Example 1.2.4.** *Now we consider the case when  $X$  is a general finite type affine scheme over  $\text{Spec}(\mathbb{C})$ , it can be defined as*

$$\text{Spec}(\mathbb{C}[x_1, \dots, x_m]/(F_1, \dots, F_k)).$$

*The same reasoning as in the Example 1.2.3 shows that the set  $\text{Mor}(\text{Spec}(R), JX)$  can be identified with the set of  $a_i(t) := \phi(x_i) \in R[[t]]$  such that*

$$(1.2.1) \quad F_j(a_1(t), \dots, a_n(t)) = 0$$

*for all  $j = 1, \dots, k$ .*

*To describe this set of formal power series, consider the algebra  $\mathcal{R} := \mathbb{C}[x_{i,n}]$  (cf. Example 1.2.3). Define a derivation  $T \in \text{Der}_{\mathbb{C}}(\mathcal{R})$  on the free generators by:*

$$T : x_{j,n} \mapsto -nx_{j,n-1}.$$

*Now, define  $F_j^\# := F_j(x_{i,-1})$ . One can show that the system of equations (1.2.1) is equivalent to  $T^\ell F_j^\# = 0$  for all possible  $\ell \geq 0$  and  $j = 1, \dots, k$ . So for  $JX$  we can take the closed subscheme of  $J\mathbb{A}^m$  given by the equations  $T^\ell F_j^\#$ :*

$$JX = \text{Spec}(\mathcal{R}/(T^\ell F_j^\#)).$$

**Remark 1.2.5.** *We have an algebra homomorphism  $\mathbb{C}[X] \rightarrow \mathbb{C}[JX]$  sending  $F = F(x_1, \dots, x_m)$  to  $F^\#$  defined by  $F(x_{1,-1}, \dots, x_{m,-1})$ . It yields a scheme morphism  $JX \rightarrow X$ .*

**Exercise 1.2.6.** *Let  $X, Y$  be finite type affine schemes (over  $\text{Spec}(\mathbb{C})$ ). Identify  $J(X \times Y)$  with  $JX \times JY$ . More precisely, let  $\pi_1 : X \times Y \rightarrow X$  and  $\pi_2 : X \times Y \rightarrow Y$  be the projections. Then  $J\pi_1 \times J\pi_2 : J(X \times Y) \xrightarrow{\sim} JX \times JY$ .*

1.2.3. *Gluing.* Now we proceed to the case of non-affine finite type schemes  $Y$ . We claim that  $JY$  can be glued from  $JX$  for open affines  $X \subset Y$ . The key step here is to relate  $JX$  and  $J(X_f)$  for  $f \in \mathbb{C}[X]$ , where  $X_f$  is the non-vanishing locus for  $f$  (known as a principal open subset). We claim that  $J(X_f)$  is naturally identified with  $(JX)_{f^\#}$ , where  $f^\# \in \mathbb{C}[JX]$  is defined in Remark 1.2.5.

Indeed, recall that if  $\mathbb{C}[X] = \mathbb{C}[x_1, \dots, x_m]/(F_1, \dots, F_k)$ , then

$$\mathbb{C}[X_f] = \mathbb{C}[x_1, \dots, x_m, x]/(F_1, \dots, F_k, xf - 1).$$

It follows that  $\mathbb{C}[J(X_f)] = \mathbb{C}[JX][x_n \mid n < 0]/(T^\ell(xf - 1)^\#)$ . For  $\ell = 0$ , the equation  $T^\ell(xf - 1)^\# = 0$  means that  $x_{-1}f^\# = 1$ , i.e.,  $f^\#$  is invertible, and  $x_{-1} = (f^\#)^{-1}$ . The equation  $T^\ell(xf - 1)^\# = 0$  for

$\ell > 0$  then uniquely expresses  $x_{-\ell-1}$  as a polynomial in  $x_{-1}, \dots, x_{-\ell}, (f^\#)^{-1}$  and elements of  $\mathbb{C}[JX]$ . This gives the required identification  $\mathbb{C}[J(X_f)] \cong \mathbb{C}[JX][(f^\#)^{-1}]$ .

This discussion finishes our sketch of proof of Proposition 1.2.2.

**Remark 1.2.7.** *Note that we still have a morphism  $JY \rightarrow Y$ . It is affine (of infinite type).*

1.2.4.  *$n$ th order jets.* Let  $X$  be a finite type scheme over  $\text{Spec}(\mathbb{C})$ . It turns out that  $JX$  (which is an infinite type scheme) can be presented as the inverse limit of finite type schemes  $J_n X$  ( *$n$ -th order jet schemes*). By definition,  $J_n X$  represents the functor  $\text{CommAlg} \rightarrow \text{Sets}$  sending  $R$  to the set of morphisms  $\text{Spec}(R[t]/(t^{n+1})) \rightarrow X$ .

For example, for  $X$  as in Example 1.2.4, we have

$$J_n X = \text{Spec}(\mathbb{C}[JX]/(x_{i,N} | i = 1, \dots, m, N < -n - 1)).$$

As in the case of  $J$ ,  $J_n$  is a functor (in this case, from the category of finite type schemes over  $\text{Spec}(\mathbb{C})$  to itself). The claim that  $J = \varprojlim_{n \rightarrow \infty} J_n$  is left as an exercise (on the general categorical nonsense).

**Exercise 1.2.8.** *For  $X$  smooth, show that  $J_1 X$  is the tangent bundle of  $X$ .*

1.2.5. *Smoothness.* The goal of this part is to prove the following statement.

**Theorem 1.2.9.** *For a smooth morphism  $\varphi : X \rightarrow Y$ , the morphism  $J_n \varphi : J_n(X) \rightarrow J_n(Y)$  is smooth as well.<sup>1</sup>*

Indeed, let us recall the following criterion of smoothness ([1, Section 1.4]). If  $R$  is a commutative  $\mathbb{C}$ -algebra, then by its *nilpotent extension* we mean a commutative algebra  $R_1$  equipped with an epimorphism  $R_1 \rightarrow R$  whose kernel is a nilpotent ideal.

**Proposition 1.2.10.** *Suppose that  $g : A \rightarrow B$  is a morphism of schemes of finite type over  $\mathbb{C}$ . Then,  $g$  is smooth if and only if for any morphism  $h : S = \text{Spec}(R) \rightarrow B$  which lifts to  $h' : S \rightarrow A$  the following holds:*

*suppose that  $R_1$  is a nilpotent extension of  $R$ , that  $S_1 = \text{Spec}(R_1)$ , and that  $h_1 : S_1 \rightarrow B$  is any lifting of  $h$ . Then  $h_1$  also lifts to  $h'_1 : S_1 \rightarrow A$ :*

$$\begin{array}{ccc} S & \xrightarrow{h'} & A \\ \downarrow & \nearrow \exists h'_1 & \downarrow g \\ S_1 & \xrightarrow{h_1} & B \end{array}$$

*Proof of Theorem 1.2.9.* By definition, an  $R$ -point of  $J_n A$  is an  $R[t]/(t^{n+1})$ -point of  $A$ . Now, we have the diagram

$$\begin{array}{ccc} \text{Spec } R[t]/(t^{n+1}) & \xrightarrow{h'} & X \\ \downarrow & \nearrow \exists h'_1 & \downarrow f \\ \text{Spec } R_1[t]/(t^{n+1}) & \xrightarrow{h_1} & Y, \end{array}$$

where we need to prove the existence of  $h'_1$ . To finish the proof we combine Proposition 1.2.10 with the observation that  $R_1[t]/(t^{n+1})$  is a nilpotent extension of  $R[t]/(t^{n+1})$ .  $\square$

**Remark 1.2.11.** *The similar argument proves that, for a surjective smooth morphism  $f$ , the morphism  $J_n f$  is also surjective (on the level of  $\mathbb{C}$ -points) for all  $n$ .*

Applying Theorem 1.2.9 to  $Y = \text{pt}$ , we get the following claim.

<sup>1</sup>One can introduce the notion of “formal smoothness”. Then, the same statement would be true for the functor  $J$  itself (instead of  $J_n$ ’s).

**Corollary 1.2.12.** *For a smooth variety  $X$ , the scheme  $J_n X$  is a smooth scheme of finite type.*

The following exercise (based on the generic smoothness) will be used below.

**Exercise 1.2.13.** *Let  $\varphi : X \rightarrow Y$  be a dominant morphism to a smooth variety  $Y$ . Prove that  $J_n \varphi : J_n X \rightarrow J_n Y$  is dominant.*

**1.3. Jet-theoretic Chevalley theorem.** Recall that we write  $\mathcal{O}$  for the algebra  $\mathbb{C}[[t]]$ . For an affine scheme  $X$  we will often write  $X_{\mathcal{O}}$  for  $JX$ .

Let  $G$  be an algebraic group. Applying the functoriality of  $J_n$  and  $J$  to the structure maps of  $G$ , we see that  $J_n G, JG$  are group schemes over  $\mathbb{C}$ . In fact,  $J_n G$  is an honest algebraic group with Lie algebra  $\mathfrak{g} \otimes \mathbb{C}[t]/(t^{n+1}) - J_n G$  is the semi-direct product of  $G$  with the unipotent group  $\exp(t\mathfrak{g}[t]/t^{n+1}\mathfrak{g}[t])$ . This description shows, in particular, that  $J_{n+1}G \twoheadrightarrow J_n G$  for all  $n$ . And  $JG$  is the limit  $\varprojlim_{n \rightarrow \infty} J_n G$ , hence a pro-algebraic group.

Applying the functor  $J$  to the action morphism  $G \times \mathfrak{g} \rightarrow \mathfrak{g}$  we get the morphism  $J(G \times \mathfrak{g}) \rightarrow J\mathfrak{g}$ . Under the identification  $JG \times J\mathfrak{g} \cong J(G \times \mathfrak{g})$  from Exercise 1.2.6, this gives an action of the pro-algebraic group  $JG$  on  $J\mathfrak{g}$ . We want to compute the algebra of invariant polynomial functions for this action.

The following result is a jet analog of Proposition 1.1.1. Recall that  $P_i, i = 1, \dots, r$ , denote free homogeneous generators of the algebra  $\mathbb{C}[\mathfrak{g}]^G$ . Then we can form the elements  $P_{i,n} \in \mathbb{C}[\mathfrak{g}_{\mathcal{O}}]^{G_{\mathcal{O}}}$  for all  $\ell < 0$  and  $i = 1, \dots, r$ , see [5, Section 3.4].

**Theorem 1.3.1.** *The algebra of invariants  $\mathbb{C}[\mathfrak{g}_{\mathcal{O}}]^{G_{\mathcal{O}}}$  is identified with  $\mathbb{C}[J(\mathfrak{h}/W)]$ , equivalently, is freely generated by the elements  $P_{i,\ell}$ .*

**1.3.1. Preparation.** We write  $\mathfrak{g}/G := \text{Spec}(\mathbb{C}[\mathfrak{g}]^G)$ . We have the quotient morphism  $\pi : \mathfrak{g} \rightarrow \mathfrak{g}/G$  induced by the inclusion  $\mathbb{C}[\mathfrak{g}]^G \hookrightarrow \mathbb{C}[\mathfrak{g}]$ . It gives rise to  $J\pi : J\mathfrak{g} \rightarrow J(\mathfrak{g}/G)$ . By the Chevalley theorem,  $\mathfrak{g}/G$  is an affine space with coordinates  $P_1, \dots, P_r$ . The polynomials  $P_{i,\ell}$  are nothing else but the coordinates on the infinite dimensional affine space  $J(\mathfrak{g}/G)$ . So our job is to show that the pullback homomorphism  $(J\pi)^*$  identifies  $\mathbb{C}[J(\mathfrak{g}/G)]$  with the subalgebra of invariants for  $G_{\mathcal{O}} = JG$  in  $\mathbb{C}[J\mathfrak{g}]$ .

We are going to reduce this to the analogous claim, where  $J$  is replaced with  $J_n$ :  $(J_n \pi)^*$  identifies  $\mathbb{C}[J_n(\mathfrak{g}/G)]$  with  $\mathbb{C}[J_n \mathfrak{g}]^{J_n G}$ . Proving the latter for all  $n$  is enough for the following reason. Since  $\mathbb{C}[J\mathfrak{g}]$  is the union of its subalgebras  $\mathbb{C}[J_n \mathfrak{g}]$ , we see that  $\mathbb{C}[J\mathfrak{g}]^{JG}$  is the union of its subalgebras  $\mathbb{C}[J\mathfrak{g}]^{JG} \cap \mathbb{C}[J_n \mathfrak{g}]$ . Our reduction now follows from the next exercise (where one needs to use that  $JG \twoheadrightarrow J_n G$  and that the projection  $J\mathfrak{g} \rightarrow J_n \mathfrak{g}$  is  $JG$ -equivariant).

**Exercise 1.3.2.**  $\mathbb{C}[J\mathfrak{g}]^{JG} \cap \mathbb{C}[J_n \mathfrak{g}] = \mathbb{C}[J_n \mathfrak{g}]^{J_n G}$  as subalgebras in  $\mathbb{C}[J\mathfrak{g}]$ .

**1.3.2. 1st proof of  $\mathbb{C}[J_n(\mathfrak{g}/J_n G)] \xrightarrow{\sim} \mathbb{C}[J_n \mathfrak{g}]^{J_n G}$ .** In this proof, different from what is given in [2, Section 3.4] we will use the Kostant slice, a remarkable affine subspace  $S \subset \mathfrak{g}$  with the property that the restriction of the quotient morphism  $\pi : \mathfrak{g} \rightarrow \mathfrak{g}/G := \text{Spec}(\mathbb{C}[\mathfrak{g}]^G)$  to  $S$  is an isomorphism. For more on Kostant slices see [6]. In particular the claim that  $\pi|_S$  is an isomorphism is proved in [6, Section 4].

Let  $\iota$  denote the inclusion  $S \hookrightarrow \mathfrak{g}$ . Since  $\pi \circ \iota$  is an isomorphism  $S \xrightarrow{\sim} \mathfrak{g}/G$ , we see that  $J_n \pi \circ J_n \iota : J_n S \xrightarrow{\sim} J_n(\mathfrak{g}/G)$ . It remains to show that  $(J_n \iota)^*$  embeds  $\mathbb{C}[J_n \mathfrak{g}]^{J_n G}$  into  $\mathbb{C}[J_n S]$ .

Let  $\beta$  denote the action map  $G \times S \rightarrow \mathfrak{g}, (g, s) \mapsto \text{Ad}(g)s$ , and  $\iota'$  denote the embedding  $S \hookrightarrow G \times S, s \mapsto (1, s)$ . Note that  $\iota = \beta \circ \iota'$ , hence  $J_n \iota = J_n \beta \circ J_n \iota'$ . The action of  $G$  on  $G \times S$  (by left translations on the first factor) gives rise to an action of  $J_n G$  on  $J_n(G \times S) = J_n G \times J_n S$  (also by left translation on the first factor). So  $(J_n \iota')^*$  restricts to an isomorphism  $\mathbb{C}[J_n(G \times S)]^{J_n G} \xrightarrow{\sim} \mathbb{C}[J_n S]$ . So, the claim that  $(J_n \iota^*) : \mathbb{C}[J_n \mathfrak{g}]^{J_n G} \hookrightarrow \mathbb{C}[J_n S]$  is equivalent to  $(J_n \beta)^* : \mathbb{C}[J_n \mathfrak{g}]^{J_n G} \hookrightarrow \mathbb{C}[J_n(G \times S)]^{J_n G}$ , which will follow from  $(J_n \beta)^* : \mathbb{C}[J_n \mathfrak{g}] \hookrightarrow \mathbb{C}[J_n(G \times S)]$ . To see the latter injectivity, we remark that  $\beta : G \times S \rightarrow \mathfrak{g}$  is dominant (Step 1 of the proof of Theorem in [6, Section 4]) and use Exercise 1.2.13. This completes the 1st proof of Theorem 1.3.1.

1.3.3. *2nd proof of  $\mathbb{C}[J_n(\mathfrak{g} // J_n G)] \xrightarrow{\sim} \mathbb{C}[J_n \mathfrak{g}]^{J_n G}$ .* Now we give a proof that closely follows one in [2]. Consider the open subset of regular elements:

$$\mathfrak{g}^{reg} = \{x \in \mathfrak{g} \mid \dim Z_{\mathfrak{g}}(x) = \text{rk } \mathfrak{g}\},$$

studied in detail in [6, Section 5]. In particular, we have the following claim

- (\*) The morphism  $\pi|_{\mathfrak{g}^{reg}}$  is smooth, and each fiber of  $\pi|_{\mathfrak{g}^{reg}} : \mathfrak{g}^{reg} \rightarrow \mathfrak{g} // G$  is a single  $G$ -orbit (in particular, the morphism is surjective).

**Exercise 1.3.3.** *For  $\mathfrak{g} = \mathfrak{sl}_n$ , the subset  $\mathfrak{g}^{reg}$  consists precisely of all matrices such that in their Jordan normal form, there is a single block for each eigenvalue.*

Suppose, for a moment, that we know that the direct analog of (\*) holds for the action of  $J_n G$  on  $J_n \mathfrak{g}^{reg}$  and the morphism  $J_n(\pi|_{\mathfrak{g}^{reg}}) : J_n \mathfrak{g}^{reg} \rightarrow J_n(\mathfrak{g} // G)$ . We then can prove that  $\mathbb{C}[J_n(\mathfrak{g} // G)] \xrightarrow{\sim} \mathbb{C}[J_n \mathfrak{g}]^{J_n G}$  using the following general result.

**Proposition 1.3.4.** *Let  $H$  be an algebraic group and  $X, Y$  be normal algebraic varieties. Suppose  $H$  acts on  $X$ , and  $Y$  is affine. Suppose, further, that  $\varphi : X \rightarrow Y$  is a surjective  $H$ -invariant morphism such that each fiber of  $\phi$  is a single  $H$ -orbit. Then  $\varphi^* : \mathbb{C}[Y] \xrightarrow{\sim} \mathbb{C}[X]^H$ .*

*Proof.* Clearly,  $\varphi^* : \mathbb{C}[Y] \hookrightarrow \mathbb{C}[X]^H$  and we need to prove the surjectivity. Take  $f \in \mathbb{C}[X]^H$ , and consider the subalgebra of  $\mathbb{C}[X]^H$  generated by  $\mathbb{C}[Y]$  and  $f$ , denote it by  $A$ . Then  $\varphi$  factors as  $X \rightarrow \text{Spec}(A) \rightarrow Y$ , where both morphisms are dominant. Since each fiber of  $\varphi$  is a single orbit,  $\text{Spec}(A) \rightarrow Y$  is injective. Any injective dominant morphism is birational, hence  $f$  can be viewed as a rational function on  $Y$ . It is left as an exercise to show that  $f$  has no poles on  $Y$ . Since  $Y$  is normal,  $f \in \text{im } \varphi^*$ . This finishes the proof.  $\square$

We apply this to  $X = J_n \mathfrak{g}^{reg}$ ,  $Y = J_n(\mathfrak{g} // G)$  and  $H = J_n G$ . Note that  $J_n(\mathfrak{g} // G)$  is smooth, hence normal, we use the analog of (\*) to deduce  $\mathbb{C}[J_n(\mathfrak{g} // J_n G)] \xrightarrow{\sim} \mathbb{C}[J_n(\mathfrak{g}^{reg})]^{J_n G}$ . The subvariety  $J_n(\mathfrak{g}^{reg}) \subset J_n \mathfrak{g}$  is open and dense. So the restriction homomorphism  $\mathbb{C}[J_n \mathfrak{g}] \rightarrow \mathbb{C}[J_n(\mathfrak{g}^{reg})]$  is injective. From here we deduce that  $\mathbb{C}[J_n(\mathfrak{g} // J_n G)] \xrightarrow{\sim} \mathbb{C}[J_n \mathfrak{g}]^{J_n G}$ .

Now, it remains to establish that analog. First, we reformulate the claim.

**Exercise 1.3.5.** *Let  $H$  be an algebraic group acting on a variety  $X$ ,  $Y$  is a variety, and  $\varphi : X \rightarrow Y$  be an  $H$ -invariant morphism. The following claims are equivalent.*

- (a) *The morphism  $\varphi$  is smooth and each fiber of  $\varphi$  is a single  $H$ -orbit.*
- (b) *The morphism  $H \times X \rightarrow X \times_Y X$ ,  $(h, x) \mapsto (hx, x)$  is smooth and surjective.*

Apply Exercise 1.3.5 to  $H = G$ ,  $X = \mathfrak{g}^{reg}$ ,  $Y = \mathfrak{g} // G$ ,  $\varphi = \pi|_{\mathfrak{g}^{reg}}$  to get that  $G \times \mathfrak{g}^{reg} \rightarrow \mathfrak{g}^{reg} \times_{\mathfrak{g} // G} \mathfrak{g}^{reg}$  is smooth and surjective. Hence, by Section 1.2.5,  $J_n(G \times \mathfrak{g}^{reg}) \rightarrow J_n(\mathfrak{g}^{reg} \times_{\mathfrak{g} // G} \mathfrak{g}^{reg})$ . One can use the smoothness of  $\pi|_{\mathfrak{g}^{reg}}$  and generalize Exercise 1.2.6, to identify  $J_n(\mathfrak{g}^{reg} \times_{\mathfrak{g} // G} \mathfrak{g}^{reg})$  with  $J_n(\mathfrak{g}^{reg}) \times_{J_n(\mathfrak{g} // G)} J_n(\mathfrak{g}^{reg})$ . We get (b) of Exercise 1.3.5 for  $H = J_n G$ ,  $X = J_n(\mathfrak{g}^{reg})$ ,  $Y = J_n(\mathfrak{g} // G)$ ,  $\varphi = J_n(\pi|_{\mathfrak{g}^{reg}})$ , yielding (a), which is what we need to finish the proof.
