**Appendix**

Nov 5, 2026.

This appendix contains the list of AI uses that have to be (or should be) acknowledged in the work submitted in the degree program. The students are strongly encouraged to report AI uses in the work that they make public. The list reflects our current understanding of AI use in papers. We anticipate that the list below might be updated in the future, as LLM mathematical capabilities and the community response to them evolves.

A list of good (and less good) examples of acknowledging AI in papers is going to appear in a separate "Good practices" document.

It is recommended but not required that students mention specific AI models they used.

If in doubt about implementing these guidelines, please consult with your advisor or the DGS.'

I) Uses that have to be acknowledged. Such uses significantly influence intellectual content.

1) Proof generation, ranging from a potential lemma, to a theorem, to an entire paper. All results obtained using AI should be disclosed in detail. Similarly, if a substantial part of the text of the paper is generated by AI, this has to be acknowledged as well.
2) Brainstorming. Ideas coming from AI or produced together with AI have to be acknowledged. This should include a reasonably complete list of results where AI produced (on its own or with your input) useful ideas and a description of these ideas.

II) Uses that have to be acknowledged in some circumstances.

3) Self-refereeing – checking the correctness of your work. This has to be acknowledged if AI found substantial mistakes (such as missing assumptions, wrong statements, or mistakes in the proof).
4) Coding and numerical exploration – if this resulted in conclusions important for the work.

III) Uses that students are encouraged to acknowledge.

5) In-depth exploration of a subject area (AI is asked to teach some subject) including an extensive literature search during the preparation of the work in question (beyond using standard search engines).
6) Autoformalization of a proof (say, in Lean) done by AI.
7) Language editing especially if AI gave you substantial help.
8) Making figures – provide a list of figures that are AI generated.
